

Prisca

5.1.0.17

Date of report: 08/04/21

Patient data			
Name	Mrs. PUSHPA		Patient ID
Birthday	13/06/96	Sample ID	21088808
Age at sample date	24.8	Sample Date	07/04/21
Gestational age	12 + 4		
Correction factors			
Fetuses	1	IVF	no
Weight	65	diabetes	no
Smoker	no	Origin	Asian
		Previous trisomy 21 pregnancies	unknown
Biochemical data		Ultrasound data	
Parameter	Value	Corr. MoM	Gestational age
PAPP-A	2.98 mIU/mL	0.81	Method
fb-hCG	41.36 ng/mL	1.03	Scan date
Risks at sampling date			Crown rump length in mm
Age risk	1:971		52
Biochemical T21 risk	1:3589		Nuchal translucency MoM
Combined trisomy 21 risk	<1:10000		1.06
Trisomy 13/18 + NT	<1:10000		Nasal bone
			unknown
			Sonographer
			DR NA
			Qualifications in measuring NT
			MD
Risk			Trisomy 21
The graph shows a risk curve that increases with age. A horizontal line at 1:10000 is labeled 'Cut off'. The area below this line is divided into three colored regions: red (top), yellow (middle), and green (bottom). A black vertical bar is positioned at age 25, reaching up to the 1:10000 risk level, which is in the green region.			The calculated risk for Trisomy 21 (with nuchal translucency) is below the cut off, which indicates a low risk. After the result of the Trisomy 21 test (with NT) it is expected that among more than 10000 women with the same data, there is one woman with a trisomy 21 pregnancy. The calculated risk by PRISCA depends on the accuracy of the information provided by the referring physician. Please note that risk calculations are statistical approaches and have no diagnostic value! The patient combined risk presumes the NT measurement was done according to accepted guidelines (Prenat Diagn 18: 511-523 (1998)). The laboratory can not be hold responsible for their impact on the risk assessment ! Calculated risks have no diagnostic value!
Trisomy 13/18 + NT			
The calculated risk for trisomy 13/18 (with nuchal translucency) is < 1:10000, which represents a low risk.
