Dr. Richa Gupta

MBBS, DMRD (Radiodiagnosis)

Former Radiologist :

- Topiwala National Medical College, Mumbai.
- Jaslok Hospital and Research Centre, Mumbai.
- Wockhardt Hospital, Mumbai.

Contact Detail.: Ph.No. 0755-3582572, Mo. : 8602790907, 8602690904, Email : richadiagnostic@gmail.com

Patient's Name:- SMT. ASMA
Ref. by:- DR. JUHI AGARWAL (MBBS MD)

Age/Sex :-28 Y/F
DATE :- 07/09/2022

Down's screening protocol (11 to 14th weeks scan) (45 to 84 mm CRL)

LMP-07/06/2022

EDD(LMP)-14-03-2023

GA(LMP)- 13 W 1 D

- ☆ **Nasal bone (NB)** – Both foetal nasal bones appears ossified & normal for gestational age .
- ☆ **Nuchal translucency (NT)** – Nuchal translucency measured at midline sagittal foetal position is profile view measured = 2.19 mm by automated NT software measurement appears to fall within normal range for gestational age.
- ☆ **Tricuspid regurgitation** – Four chamber cardiac view of foetus appears normal all the foetal chambers showing normal contractility on grey scale imaging on colour doppler examination both AV valves appears normal no evidence of any obvious tricuspid regurgitation visualized on ventricular systole.
- ☆ **Ductus venous** – Foetal ducts venous localized in intra portion connecting the umbilical vein to IVC, shows normal flow on colour doppler examination spectral doppler study reveal normal continues biphasic flow, S wave, DW are & a wave appears normal no evidence of any reversal of A wave noted suggestive of - Normal ductal venous flow indices.

Biometry –

- Foetal CRL measuring 61.15 mm corresponds to 12 wks 4 days of gestational age.
- Expected Date of Delivery = 18/03/2023
- Cardiac activity measuring 168 beats/min appears regular and rhythmic.
- Internal os is closed & cervical length is well maintained (cervical length measured = 2.8 cm).
- Placenta is Anterior involving upper mid & lower uterine segment reaching upto the os, suggestive of - lowlying placenta. (Grade-Zero)
- No evidence of any concealed haemorrhage.
- Liquor is adequate with normal foetal movements noted.
- Both ovaries appears normal in size, shape & echopattern.
- Bilateral adnexal region appear normal in echopattern.

Add - 41/A NEAR GPO, MOTIYA TALAB ROAD, ROYAL MARKET, BHOPAL (M.P.)

IMPRESSION: -

- ☆ Single live intrauterine foetus corresponds to 12 wks 4 days of gestational age reveal normally ossified with nasal bones normal ductal venous spectral flow pattern, no evidence of tricuspid regurgitation & nuchal translucency fall with normal range for gestational age.
- ☆ Nuchal translucency measured = 2.19 mm by automated NT software.
- ☆ Placenta is lowlying reaching upto the os.
- ☆ Right uterine PI measured = 1.04, left uterine PI measured = 1.01 mean uterine PI measured = 1.02 appears to fall within normal limits for the gestational age (screen negative for preeclampsia).

Advice :- Biochemical marker correlation and Target Scan at 18 to 20 weeks

Declaration of Doctor / Person conducting U.S.G./Image Scanning

I, **Dr. Richa Gupta** declare that while conducting U.S.G. on Smt. Asma

I have neither declared nor disclosed the sex of her foetus to anybody in any manner.

(This report is only a professional opinion and not the diagnosis. It should be clinically interpreted by the Clinician)
