PLEASE NOTE

- This investigation has been done as per the request of the referring doctor.
- Sex of the fetus is not disclosed or mentioned to anybody in any manner.
- It must be noted that detailed fetal anatomy may not always be visible due to technical difficulties related to fetal position, amniotic fluid volume, fetal movements and maternal abdominal wall thickness.
- Basic evaluation of the heart is done in this examination. Fetal echo is not a part of this study and should be done around 23-24 weeks when visualisation of heart is better.
- Furthermore all fetal anomalies may not necessarily be detected at every examination.
- All measurements including fetal weight are subject to statistical variations.
- In case of disparity between report and clinical evaluation, second opinion is advisable before commencing the final treatment.
