(Reg No. 2016/12/4963)

	RI	PI	S/D	Percentile of PI
Right Uterine Artery	1	4.5	--	> 99 Centiles Pathological
Left uterine Artery	0.8	2.2	7.6	

Right uterine artery and left uterine artery reveal high resistance flow.

CONCLUSION:

- Single live intrauterine pregnancy corresponding with 13 weeks 0 day and near normal interval growth.
- Nuchal scan is within normal limits.
- High resistance flow in bilateral uterine arteries. (High risk preeclampsia/IUGR)

Suggest- Dual marker and combined risk assessment.

Anomaly scan between 19-20 weeks.

All fetal measurements including fetal weight are subject to known statistical variations. Not all anomalies can be detected on ultrasound due to varying fetal position, amounts of liquor, fetal movements and abdominal wall thickness.

DECLARATION OF DOCTOR - I, Dr Jitesh Serkure declare that while conducting ultrasonography/image scanning, I have neither detected nor disclosed the sex of her foetus to anybody in any manner.
