ECHOGENIC CARDIAC FOCUS IN LV.

There is a single Echogenic Intracardiac Focus (EIF) in the left cardiac ventricle. There are no structural abnormalities or other markers for chromosomal abnormalities.

I have explained to the couple that EIF is present in about 5% (1 in 20) normal babies. This is not a heart defect and does not affect the function of the heart in any significant way.

It is a soft marker for Down's Syndrome but as an isolated finding, it does not increase the risk of Down Syndrome. The likelihood ratio of isolated EIF is 0.98 for trisomy 21. (Ref: Meta analysis of second trimester markers UOG 2013)

The EIF in itself does not warrant any structural cardiac follow up (prenatal/postnatal).

Suggested QUADRUPLE MARKER.

Suggested GROWTH SCAN at 28 to 30 weeks.

I, Dr. L. Kalpana reddy, declared that while conducting ultrasonography / imaging scanning on Mrs. MOUNIKA, I have neither detected nor disclosed the sex of her fetus to any body in any manner.
