

Patient data			
Name	Mrs. B AKHILA	Patient ID	0012305170144
Birthday	23-12-2003	Sample ID	24215866
Age at sample date	19.4	Sample Date	17-05-2023
Gestational age	12 + 1		
Correction factors			
Fetuses	1	IVF	no
Weight	75	diabetes	no
Smoker	no	Origin	Asian
		Previous trisomy 21 pregnancies	unknown
Biochemical data		Ultrasound data	
Parameter	Value	Corr. MoM	
PAPP-A	3.48 mIU/mL	1.35	
fb-hCG	45.65 ng/mL	1.07	
Risks at sampling date			
Age risk		1:1081	
Biochemical T21 risk		<1:10000	
Combined trisomy 21 risk		<1:10000	
Trisomy 13/18 + NT		<1:10000	
			Gestational age 12 + 0
			Method CRL Robinson
			Scan date 16-05-2023
			Crown rump length in mm 55.32
			Nuchal translucency MoM 0.97
			Nasal bone unknown
			Sonographer NA
			Qualifications in measuring NT MD
Risk			Trisomy 21
The graph shows a risk curve that increases with age. At age 19, the risk is approximately 1:1081, which is below the cut-off line. The area below the cut-off is divided into yellow (below cut-off but above age risk) and green (below cut-off) regions.			The calculated risk for Trisomy 21 (with nuchal translucency) is below the cut off, which indicates a low risk. After the result of the Trisomy 21 test (with NT) it is expected that among more than 10000 women with the same data, there is one woman with a trisomy 21 pregnancy. The calculated risk by PRISCA depends on the accuracy of the information provided by the referring physician. Please note that risk calculations are statistical approaches and have no diagnostic value! The patient combined risk presumes the NT measurement was done according to accepted guidelines (Prenat Diagn 18: 511-523 (1998)). The laboratory can not be hold responsible for their impact on the risk assessment ! Calculated risks have no diagnostic value!
Trisomy 13/18 + NT			
The calculated risk for trisomy 13/18 (with nuchal translucency) is < 1:10000, which represents a low risk.
