## USG OBSTETRIC

L.M.P: 27/04/2023  
EDD BY L.M.P.: 01/02/2024  
Period of amenorrhoea: 12 weeks, 2 days.

Uterus is gravid.

A single smooth intrauterine gestational sac is seen.  
No separation of the gestational sac or any subchorionic hematoma is seen at present scan.

A single fetus is seen inside the gestational sac.  
Fetal cardiac activity is seen and appears normal. FHR is 183 bts/min.  
CRL is 55 mms corresponding to 12 weeks, 1 day.

Nuchal translucency measures 1.1 mms.  
Nasal bone is seen. Ductus venosus flow is normal.  
Evaluation of fetal structure is suboptimal due to thick maternal anterior abdominal wall. Midline falx, intra cranial translucency, three segments of each limb, and stomach bubble are seen. No obvious ventral wall defect is detected.

Liquor is adequate. Placenta is forming anteriorly.  
Internal OS is closed. Cervical length is 40 mm.

Right uterine artery PI is 2.97. Left uterine artery PI is 1.95. Mean uterine artery PI is within normal limits for gestational age.

## CONCLUSION:

Single live intrauterine pregnancy corresponding to 12 weeks, 1 day.

Suggest: Follow up USG for anomaly scan at 19 to 20 weeks.

Many thanks for the reference,

(I declare that during the examination, I have neither detected nor disclosed the sex of the foetus to any body in any manner.  
Not all anomalies can be detected on sonography depending upon various factor like gestational age, fetal position, amount of liquor, maternal abdominal wall thickness, patient co-operation etc.)

I declare that by undergoing ultrasonography / image scanning etc. I do not want to know the sex of my foetus.  
माझी करण्यात येणारी सोनोग्राफी ही गर्भाला निदानासाठी नाही याची मला जाणीव आहे. यासाठी मी स्वेच्छेने संमती देत आहे.
