Risk			Trisomy 21
The graph illustrates the risk of Trisomy 21 based on gestational age. The y-axis shows risk levels from 1:10 to 1:10000. The x-axis shows age from 13 to 49. A red region at the top indicates risk above the cut-off. A yellow region in the middle indicates risk below the cut-off but above the age risk. A green region at the bottom indicates risk below the cut-off. A black vertical bar at age 31 shows the patient's risk level, which is below the cut-off.			The calculated risk for Trisomy 21 (with nuchal translucency) is below the cut off, which indicates a low risk. After the result of the Trisomy 21 test (with NT) it is expected that among 1231 women with the same data, there is one woman with a trisomy 21 pregnancy and 1230 women with not affected pregnancies. The calculated risk by PRISCA depends on the accuracy of the information provided by the referring physician. Please note that risk calculations are statistical approaches and have no diagnostic value! The patient combined risk presumes the NT measurement was done according to accepted guidelines (Prenat Diagn 18: 511-523 (1998)). The laboratory can not be hold responsible for their impact on the risk assessment ! Calculated risks have no diagnostic value!
Trisomy 13/18 + NT			
The calculated risk for trisomy 13/18 (with nuchal translucency) is < 1:10000, which represents a low risk.
