Preclampsia risk from history plus MAP, UTPI

37 weeks: 1 in 149

Recommendation

The risk of preclampsia was assessed by a combination of maternal characteristics and medical history with measurements of blood pressure and blood flow to the uterus.

On the basis of this assessment the patient has been classified as being at increased risk for developing PE before 37 weeks. The ASPRE trial has shown that in such women use of low dose aspirin (150mg/night) from now until 36 weeks reduces the incidence of PE before 32 weeks by about 90% and PE before 37 weeks by 60%.

R.MANSI JAIN MD,DNB,FRCR(2A) UK

CONSULTANT RADIOLOGIST

Disclaimer

All Anomalies cannot be detected by sonography & a normal ultrasound does not guarantee a normal baby.

To book prior appointment for scan - call 8989635539

or any typing error , kindly contact at reception.

25/26 Nov - Prenatal Scan
