OPINION: USG OBSTETRIC SCAN:-

- Single live, intrauterine pregnancy in **changing lie**, at present with sonic maturity approximately 14 weeks 5 days.
- Placenta is forming in anterior uterine wall, with Lower placental margin is reaching upto the internal os.
- Nuchal fold thickness is 2.8mm.
- Small left ovarian cyst ? corpus luteum cyst.

KINDLY CORRELATE CLINICALLY.
Adv Anomaly scan at 20-22wks.

I, Dr. Seema Dayani, declare that while undergoing ultrasonography on this patient, I have neither detected nor disclosed the sex of her fetus to anybody in any manner

Dr. Seema Dayani,
MD
Reg no. 88695

Thanks for referral.

Please Note: This investigation has been done as per the request of the referring doctor.
Sex of the fetus is not disclosed or mentioned to anybody in any manner.

It must be noted that detailed fetal anatomy may not always be visible due to technical difficulties related to fetal position, amniotic fluid volume, fetal movements and maternal abdominal wall thickness.

Basic evaluation of the heart is done in this examination. Fetal echo is not a part of this study and should be done around 22-24 weeks when visualization of heart is much better.

Furthermore all fetal anomalies may not necessarily be detected at every examination.

All measurements including fetal weight are subject to statistical variations.

In case of disparity between report and clinical evaluation, second opinion is advisable before commencing the final treatment.

Dr. Seema Dayani,
MD.
