Spine normal

Extremities: Upper, Lower limbs are normal

IMPRESSION:

-Single live intrauterine gestation of 18 weeks 4 days gestational age $\pm$ 2 weeks
 with no obvious anomalies

Advised F/U scan at 24 weeks to R/O progressive anomalies

DR. R. APARNA
 RADIOLOGIST

I Dr. R. APARNA declare that while conducting USG on SINDHU 19 Y/F. I have neither detected nor disclosed the sex of the fetus to anybody in any manner. Determination of fetal sex is illegal (section PNMT ACT 1994).
 Note: Inspite of sincere search all anomalies cannot be ruled out by ultra sound, since assessment of fetal anomalies depends on fetal position, liquor volume, maternal obesity and period of gestation at the time of scan.
 In BOH with HTN Doppler studies are helpful in evaluation IUGR & viability
 All GIT abnormalities & small VSD, ASD, PDA cannot be ruled out with this scan
 Ultra sound scan alone cannot exclude all genetic syndromes or chromosomal abnormalities
 Hence USG has its own limitations. Please correlate clinically. Thanks for referral

Note : The science of the radiological diagnosis is based on the interpretation of various shadows produced by both normal & abnormal tissue. Dissimilar diverse diseases produce similar shadows, hence this report is not confirmation for the diagnosis and only represents part of professional opinion in some of the various possibilities and number of variables known & unknown does exist.
