- Placenta: Fundal posterior, Grade-I.
- Ductus venosus reveals normal flow & spectral waveform.
- Bilateral uterine arteries show normal wave form and PI.

### FETAL EXTREMITIES:

- All four limbs present with no gross abnormality.

### FETAL HEAD:

- Mid line falx is well seen. Both lateral ventricles are normal in size. The posterior fossa appears normal. The cerebellum is normal.

(P.T.O.)

#### FETAL SPINE:

- Entire spine is visualized in longitudinal and transverse axis.
- The vertebrae and spinal canal appear normal.

#### FACE:

- Orbita, nose and mouth appear normal.

#### THORAX:

- **Solitary echogenic focus (2.1 mm) seen in left ventricle of heart is a soft marker for trisomy - Needs quadruple marker correlation**
- The heart appears in normal cardiac situs.
- The four chamber view is normal. Fetal echo not done.
- Both lungs are well seen.
- No evidence of diaphragmatic hernia is seen.
- No evidence of pleural or pericardial effusion.

#### ABDOMEN:

- Abdominal situs appears normal.
- Stomach, both kidneys and urinary bladder are normal.

- **Solitary echogenic focus (2.1 mm) seen in left ventricle of heart is a soft marker for trisomy - Needs quadruple marker correlation**
- No other obvious congenital anomaly detected.

Fetal echo is advised for dedicated evaluation of fetal heart (22-24 weeks).

Suggest clinical & Quadruple marker correlation.

#### Disclaimer:

Please note that USG study has certain limitations (sometimes fetal anomalies may not get diagnosed due to nature of anomaly, Gestational age, foetal positioning and limitations of machine thence absence of mention of foetal anomaly in study does not always rule out its possibility. (Fetal echo is not included in this scan).

#### Declaration:

I declare that while conducting Ultrasonography/ Image Scanning on patient I have neither detected nor disclosed the sex of her fetus to anybody in any manner.
