MMC Reg. No. 2015/04/2115

Time : 9.30 am to 4.00 pm and 5.00 pm to 8.30 pm

Patients Name : MRS. SHUBHANGI VIPUL LALSARE
Referred by : Dr. MANISHA JUMNAKE MADAM
Examination : USG - Obstetric NT Scan

Age: 25 YEARS / F
Date: 18 Dec 2023

OBSERVATION:

- #> Urinary bladder partially full.
- #> Single live intrauterine fetus is seen with CRL 80.2 mm corresponding to 14 weeks 1 day.

GA by USG	14 weeks 1 day
EDD by USG	16/06/2024

LMP	12 Aug 2023
GA by LMP	18w2d
EDD by LMP	18 May 2024

- #> Cardiac activity is seen with FHR 163 BPM. Fetal movements are well appreciated.
- #> Gestational sac is regular. Choriodecidual reaction is good. *A large subchorionic collection of size 37 x 22 mm is noted.*
- #> Placenta is forming fundoposteriorly. Retroplacental zone appears normal.
- #> Amniotic fluid is adequate.
- #> NT appears normal measuring 1.4 mm. (<5 percentile - normal for this CRE)
- #> *Non ossification of nasal bone is noted.* Ductus venosus flow appears normal.
- #> Right uterine artery PI - 2.24. Left uterine artery PI - 1.75. Mean PI - 1.99. (87 percentile - normal)
- #> Normal choroid plexus, ventricles and falx. Skull vault, upper and lower extremities are visualized.
- #> Cervical length is normal, measures 3.1 cm. Internal os is closed.

IMPRESSION:

Sonic findings suggest single live intra-uterine pregnancy with CRL corresponding to 14 weeks 1 day gestational age. NT appears normal.
Non ossification of nasal bone (absent nasal bone).
A large subchorionic collection.

Suggested correlation with dual markers and appropriate further evaluation.
Suggested anomaly scan between 18 to 23 weeks.

I declare that while undergoing ultrasonography/image scanning on this patient, I neither detected nor disclosed the sex of fetus to anybody in any manner.
All measurements including estimated fetal weight are subject to statistical variations.
THIS IS ROUTINE LEVEL ONE USG SCREENING & THIS DOES NOT INCLUDE FETAL ANOMALY SCANNING. FETAL ANOMALY SCANNING SHOULD BE ADVISED TO PATIENT AS PER CLINICAL NEED.
Not all anomalies can be detected on sonography. This scan does not include fetal ECHO.
Investigations have their limitations. Solitary radiological / pathological and other investigation never confirm the final diagnosis of disease. They only help in diagnosing the disease in correlation to symptom and other related tests. Please interpret accordingly.
