

Patient data			
Name	Mrs. SHAZMA KHAN	Patient ID	0382401080152
Birthday	11/10/85	Sample ID	A0180354
Age at sample date	38.2	Sample Date	08/01/24
Gestational age	12 + 6		
Correction factors			
Fetuses	1	IVF	no
Weight	90	diabetes	no
Smoker	no	Origin	Asian
		Previous trisomy 21 pregnancies	unknown
Biochemical data		Ultrasound data	
Parameter	Value	Corr. MoM	
PAPP-A	5.62 mIU/mL	2.05	
fb-hCG	37.07 ng/mL	1.08	
Risks at sampling date			
Age risk		1:127	
Biochemical T21 risk		1:2447	
Combined trisomy 21 risk		1:9629	
Trisomy 13/18 + NT		<1:10000	
			Gestational age 12 + 6
			Method CRL Robinson
			Scan date 08/01/24
			Crown rump length in mm 68
			Nuchal translucency MoM 0.93
			Nasal bone present
			Sonographer N A
			Qualifications in measuring NT MD
Risk			Trisomy 21
The graph shows a risk curve that increases with age. The patient's risk at age 38.2 is indicated by a black bar at the bottom of the graph, below the green area.			The calculated risk for Trisomy 21 (with nuchal translucency) is below the cut off, which indicates a low risk. After the result of the Trisomy 21 test (with NT) it is expected that among 9629 women with the same data, there is one woman with a trisomy 21 pregnancy and 9628 women with not affected pregnancies. The calculated risk by PRISCA depends on the accuracy of the information provided by the referring physician. Please note that risk calculations are statistical approaches and have no diagnostic value! The patient combined risk presumes the NT measurement was done according to accepted guidelines (Prenat Diagn 18: 511-523 (1998)). The laboratory can not be hold responsible for their impact on the risk assessment ! Calculated risks have no diagnostic value!
Trisomy 13/18 + NT			
The calculated risk for trisomy 13/18 (with nuchal translucency) is < 1:10000, which represents a low risk.
