

Patient data			
Name	Mrs. HEMA KADU		Patient ID
Birthday	08-03-1984		Sample ID
Age at sample date	40.0		Sample Date
Gestational age	12 + 0		
Correction factors			
Fetuses	1	IVF	no
Weight	59	diabetes	no
Smoker	no	Origin	Asian
			Previous trisomy 21 pregnancies
			unknown
Biochemical data			Ultrasound data
Parameter	Value	Corr. MoM	Gestational age
PAPP-A	11.35 mIU/mL	3.51	11 + 5
fb-hCG	45.22 ng/mL	0.95	Method
			CRL Robinson
			Scan date
			20-02-2024
Risks at sampling date			Crown rump length in mm
			52.4
Age risk			Nuchal translucency MoM
1:78			0.89
Biochemical T21 risk			Nasal bone
1:1991			present
Combined trisomy 21 risk			Sonographer
1:8115			NA
Trisomy 13/18 + NT			Qualifications in measuring NT
<1:10000			MD
			Trisomy 21 The calculated risk for Trisomy 21 (with nuchal translucency) is below the cut off, which indicates a low risk. After the result of the Trisomy 21 test (with NT) it is expected that among 8115 women with the same data, there is one woman with a trisomy 21 pregnancy and 8114 women with not affected pregnancies. The PAPP-A level is high. The calculated risk by PRISCA depends on the accuracy of the information provided by the referring physician. Please note that risk calculations are statistical approaches and have no diagnostic value! The patient combined risk presumes the NT measurement was done according to accepted guidelines (Prenat Diagn 18: 511-523 (1998)). The laboratory can not be hold responsible for their impact on the risk assessment ! Calculated risks have no diagnostic value!
Trisomy 13/18 + NT The calculated risk for trisomy 13/18 (with nuchal translucency) is < 1:10000, which represents a low risk.
