

Patient Name : MRS. SANGEETHA
Gender/Age : Female /32 Years
Referred By : DR P SUDHARANI

Patient Id/ Bil No. : 2402-0908
Reg. Date : 29-02-2024
Reported Date : 02-03-2024

DEPARTMENT OF RADIODIAGNOSIS AND IMAGING SONOMAMMOGRAPHY OF BOTH BREASTS

Clinical history : Lump in left breast

Technique: Ultrasound scan of breasts was performed with 7.5 MHz linear array transducer.

Findings:

well defined oval parallel homogenous hyper echoic lesion measuring 24 x 13 x 25mm noted in the subcutaneous and premammary space of left breast at 2 o'clock position in the periareolar region. Few tiny cystic components noted with in the lesion largest measuring 3.4 x 1.3mm.

Both breasts reveal predominantly fibroglandular parenchymal pattern with scanty fatty components.

No other discrete focal mass/ collection / inflammatory changes/of dilated ducts.

Pre-mammary, mammary and retromammary spaces are normal.

Both nipples, skin and subcutaneous tissues appear normal.

Both axillary regions appear normal. No significant lymphadenopathy.

Visualized pectoralis muscles appear normal.

Few bilateral axillary lymph nodes noted with preserved benign morphology. No necrosis / matting / lymphadenitis.

IMPRESSION:

- F/s/o benign lesion in soft tissue plane of left breast - likely dermoid/epidermoid/epidermal inclusion/sebaceous cyst in left breast.**

(D/D-LIPOMA)

- **Suggested clinical/FNAC correlation.**
