VID : 9161 8766 6247 4726

मेरा **आधार**, मेरी पहचान

Position of apex	Normal – apex to the left angle Of about 40 degree to midline
Systemic veins	Normal
Pulmonary veins	Normal- Separate origin to each side of left atrium
Atrial septum	Normal – Foramen ovale in the central third/half flap valve in LA
Flow at foramen ovale	Normal- Right to left
Atrioventricular junction	Normal- AV concordance Patent AV valves, equal size
AV regurgitation	Normal- non Ventricular septum intact
Ventricular function	Normal Great artery connections Normal – concordant, forward Flow in both, thin valve leaflets, Which 'disappear' in systole
Arterial valve regurgitation	Normal- None
Branch pulmonary arteries	Normal –confluent Normal size
Arteries Duct	Normal – similar in size to arch, L side unaliated flow
Aortic arch	Normal
Side of arch	Normal
	Sinus, normal rate, regular
Atrial rate	156 bpm
Ventricular rate	156 bpm
Other lesion	None

Comments :

Gestational age assignment according to LMP- 21weeks 5 days: EDD (LMP):08.07.2024
Single live Intrauterine fetus corresponding to gestational age of 19 weeks 6 days? Late Conception ? Wrong dates.

Normal Liquor: DVP 4.2 cm

Normal fetal echocardiography with EICF in left ventricle.

Counseling: EICF may be associated with Trisomy 21.

Prognosis: Isolated cases have favourable prognosis.

Advice : Quadruple marker.

Declaration of doctor:- I Dr. Manupriya Madhavan declare that while conducting ultrasonography on this patient I have detected nor disclosed sex of the fetus to anybody in any manner .

Note:-Ultrasound is a modality of diagnosis but it has its own limitations-

- It can detect structural malformations in up to 60-70% of cases depending on the organ involved
- Functional abnormalities in the fetus cannot be detected by USG.
- Condition like trisomy 21 (Down syndrome) may have normal ultrasound finding in 60% cases
- Additional tests like serum markers (double test 10-13 weeks /quadruple test at 15-20 weeks) will help in detecting more cases (70% by quadruple test/90% double test) Surgically correctable after birth.
- Subtle anomalies like polydactyly and cleft palate are not looked up in routine scan. Which are surgically correctable after birth
- Some conditions present late in intrauterine life and require serial follow up scans to rule out their presence
- All the anomalies do not manifest in intrauterine life and may present postnatally for the first time.

Dr. Manupriya Madhavan
Consultant fetal medicine
