TEST REPORT

Reg. No.:

NAME: MR. KUBER SINGH VERMA

AGE: 72 YEAR'S

Date: 02/12/2023

SEX: M

REF. BY. : DR. ASHISH CHAND DEWANGAN

TYPED BY - SV

CT SCAN OF ABDOMEN AND PELVIS (PLAIN & CONTRAST STUDY)

Indication: Known case of adenocarcinoma of colon.

OBSERVATION:-

- Asymmetrical circumferential enhancing mural thickening is noted in the rectum with maximum thickness of 10 mm from 8 O' clock to 1 O' clock location for a segment of approximately 4.1 cm at a distance of 9.3 cm from the anal verge. Mild fat stranding is noted in the mesorectum. Few (4-5) subcentimeter mesorectal lymph nodes noted, largest measuring 4.8 mm in short axis diameter.
- Subcentimeter size lymph node of size 4.5 mm in short axis diameter is noted in the right external iliac region.
- Rest of the large bowel loops are distended and loaded with fecal matter.
- The liver is normal in size and shape. A calcified focus of size 2 mm is noted in the segment VII of right lobe of liver, suggestive of calcified granuloma.
- There is no intra or extra hepatic biliary dilatation. The hepatic and portal veins appear normal.
- The gall bladder is physiologically distended, appears normal.
- Spleen is normal in size. There is no evidence of focal lesion.
- Pancreas and both adrenals are normal.
- Both kidneys are normal in size, shape and show good prompt function.
- Simple cortical cyst of size 4 x 4 mm is noted in the lower pole cortex of right kidney.
- Both ureters are normal in course and calibre.

TEST REPORT

NAME: MR. KUBER SINGH VERMA AGE: 72 YEAR'S SEX: M

- There is no free fluid is seen in peritoneal cavity.
- Urinary bladder is normal.
- Prostate is mildly enlarged in size measuring 28 cc in volume.
- Degenerative changes noted in the visualized spine in the form of marginal osteophytes noted at multiple visualized vertebral levels.

IMPRESSION:

- Asymmetrical circumferential enhancing mural thickening in the rectum as described with mild fat stranding in the mesorectum and few subcentimeter mesorectal lymph nodes.
- Subcentimeter lymph node in the right external iliac region.
- Features consistent with neoplastic etiology.
- Calcified granuloma in the segment VII of right lobe of liver.
- Right renal simple cortical cyst.
- Mild prostatomegaly.
- Needs clinical correlation.

Pathological Investigation/Radiological impression are merely opinion and the final diagnosis as they are based on available auto generated/ imaging finding. These opinions should be correlated with clinical findings a review of further evaluation may be sought whenever considered appropriate.
Condition of Reporting : 1. It is presumed that the specimen belongs to the patient named in the test request form. 2. A test request might not be performed for following reasons : a. Insufficient specimen quality b. Unacceptable specimen quality c. Incorrect specimen type d. Test cancelled either on request of patient or doctor, or because of incorrect code, test name or specimen received. It is expected that a fresh specimen (will be sent for the purpose of reporting on the same parameters (s), if required

Biopsy No : LD 89/23

Histopathology

Specimen : Rectal growth biopsy

Gross Examination : Received multiple, grey white, soft tissue pieces together measuring 0.6 x 0.5 x 0.4cm [All processed – 1 Paraffin Block]

Microscopic Examination : Section studied shows large intestinal mucosa with tubular gland and nest of neoplastic columnar epithelial cell showing stratification, marked pleomorphism, high N:C ratio, moderate cytoplasm, vesicular nuclei, prominent nucleoli and brisk mitotic activity infiltrating into surrounding stroma.

Impression : Above Histomorphological features are suggestive of Moderately differentiated Adenocarcinoma

Note : Kindly correlate clinically and with colonoscopic findings.
