First Trimester Screening Report

DESHPANDE VEDIKA

Date of birth : 11 September 2000, Examination date: 07 March 2024

First Trimester Ultrasound:

Gestational age: 12 weeks + 6 days from CRL

EDD by scan: 13 September 2024

Fetal heart activity visualised
Fetal heart rate 170 bpm
Crown-rump length (CRL) 66.2 mm
Nuchal translucency (NT) 1.3 mm
Biparietal diameter (BPD) 20.7 mm
Ductus Venosus PI 0.680

Chromosomal markers:

Nasal bone: present; Tricuspid Doppler: normal.

Uterine artery PI: 1.64

Endocervical length: 30.0 mm

Risks / Counselling:

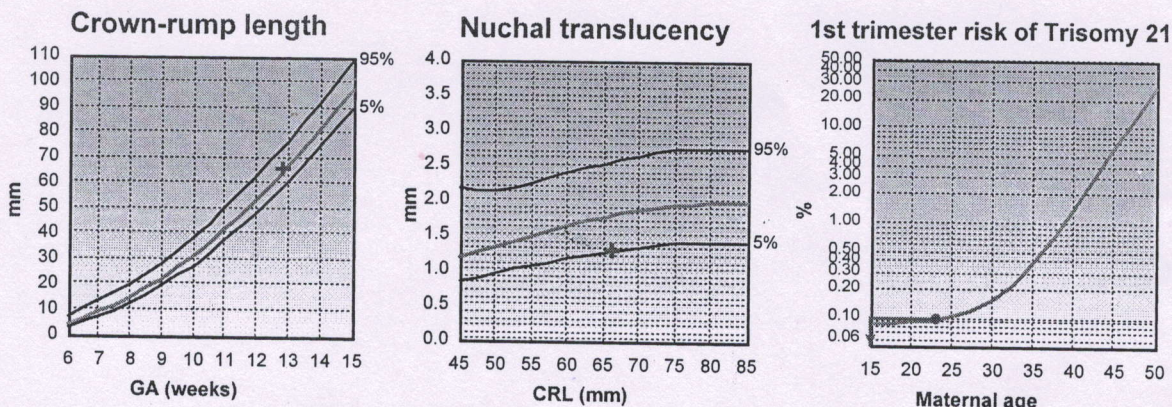

Patient counselled and consent given.

Operator: Pradnya Khadilkar, FMF Id: 189119

Condition	Background risk	Adjusted risk
Trisomy 21	1: 1031	1: 5111
Trisomy 18	1: 2546	1: 7714
Trisomy 13	1: 7978	1: 11323

The background risk for aneuploidies is based on maternal age (23 years). The adjusted risk is the risk at the time of screening, calculated on the basis of the background risk and ultrasound factors (fetal nuchal translucency thickness, fetal heart rate).

The estimated risk is calculated by the FMF-2012 software (version 2.81) and is based on findings from extensive research coordinated by the Fetal Medicine Foundation (UK Registered charity 1037116). The risk is only valid if the ultrasound scan was performed by a sonographer who has been accredited by the Fetal Medicine Foundation and has submitted results for regular audit (see www.fetalmedicine.com).

INFORMATION

This Science of U.S.G. depends upon interpretation of various shadows produced by both Normal & Abnormal structure. Hence has got limitations. The report is meant only to assist a competent medical practitioner to have an idea of diseases process, if any & is to be correlated with clinical findings & Laboratory investigations. This test should always be read in the light of clinical findings and should never be read or interpreted alone. All imaging modalities (like sonography) has its own pitfalls / short comings. Sonography is not 100% test to detection of ideal congenital anomalies or gender. Only gross congenital anomalies can be detected antenatal by sonography. Biochemical defects and some genetic syndromes cannot be detected on sonography. Even after sonography minor congenital anomalies can be missed in small percentage of patients. A normal sonography report does not exclude all defects abnormalities and similarly presence of one anomaly does not exclude other abnormalcies. No guaranty of any sonography report can be given. Patients are free to obtain a second opinion with any other doctor of their choice.

THIS HOSPITAL DOES NOT PERFORM USG FOR SEX DETECTION.
