|------------------------------------|--------------|----------------------------|
| PATIENT NAME:- MRS. KANCHAN GAWADE | | DATE:- 06/03/2024 |
| STUDY:- OBST | AGE:- YRS/ F | REF BY:- DR. RAJESH KOKARE |

OBSTETRIC SONOGRAPHY (NT SCAN)

A single live intra-uterine gestation.

Fetal cardiac activity is appreciated. FHR:- 162 BPM

Placenta is developing on posterior wall. It shows grade-0 maturity.

Cervical length is normal and measures 3.7 cm. Internal-os is closed. No evidence of any herniation or coning of gestational sac.

Amniotic fluid is adequate.

No evidence of any adnexal mass lesion. No obvious fetal congenital anomalies are seen at present examination.

Fetal Parameters are:-

| Parameters / Markers | Finding | Remark |
|----------------------|---------------------------|-------------|
| Nasal Bone | Present | Well formed |
| Nuchal translucency | 1.4 mm | Normal |
| Ductus Venosus Flow | No e/o reversal of a wave | Normal |

| | | | |
|-----|----------|----------|--------|
| CRL | 72.94 mm | 13 weeks | 3 days |
|-----|----------|----------|--------|

| | | | |
|------------|----------------|--------------------|-----------------|
| LMP | 05/12/2023 | | |
| GA by LMP | 13 weeks 1 day | GA by present USG | 13 weeks 3 days |
| EDD by LMP | 10/09/2024 | EDD by present USG | 08/09/2024 |

IMPRESSION:-

- A single live intrauterine gestation.
- Gestational age of 13 weeks 3 days.
- Bilateral uterine artery shows normal flow.
- Markers for chromosomal anomalies are unremarkable.

Suggest:- 4-D / Anomaly scan at 18 to 23 weeks of gestation.
