*Advice: Amniocentesis, /chorionic villi sampling, /Quadruple marker*

No obvious congenital anomaly seen. Not all congenital anomalies are possible to rule out due to various fetal presentation, movements, subcutaneous fat etc. Detailed genetic screening, biochemical studies, fetal echocardiography and 4D Sonography are indicated in case of high clinical suspicion.

**Foetal cardiac abnormality is not evaluated in this study. Dedicated fetal echocardiography is advised.**

**(Note:** Not all the chromosomal / congenital anomalies are seen in antenatal ultrasound, all measurement including the fetal weight, are subjected to statistical variation. Report to be interpreted by registered medical practitioner in light of other laboratory parameters. Dedicated fetal ECHO not done at the time of study)
