

Patient Name : MRS. D CHANDRA

Patient Id/ Bil No. : 2405-0839

Gender/Age : Female /77 Years

Reg. Date : 31-05-2024

Referred By : DR K PRASANNA LAKSHMI MBBS,MS (OBG) Re Reported Date : 03-06-2024

**DEPARTMENT OF RADIODIAGNOSIS AND IMAGING
SONOMAMMOGRAPHY OF BOTH BREASTS**

Clinical history : Lump in right breast

Technique: Ultrasound scan of breasts was performed with 7.5 MHz linear array transducer.

Findings:

Well defined irregular spiculated anti parallel micro-lobulated lesion measuring 31 x 23 x 31mm noted the mammary space of right breast at 8 o clock position .Multiple tiny calcific foci are noted within the lesion .The lesion is infiltrating the superficial fibers of pectoralis muscles

Both breasts reveal predominantly fibroglandular parenchymal pattern with scanty fatty components.

No other discrete focal mass/ collection / inflammatory changes/dilated ducts.

Rest of premammary, mammary and retromammary spaces are normal.

Both nipples, skin and subcutaneous tissues appear normal.

Both axillary regions appear normal. No significant lymphadenopathy.

Visualized pectoralis muscles appear normal.

Few small volume right axillary lymph-nodes noted largest measuring 12x10mm with increased hilar flow. No necrosis / matting / lymphadenitis.

IMPRESSION:

- **F/s/o a suspicious neoplasm in right breast at 8 o clock position.**
- **Suggested clinical /FNAC correlation.**
