Prisca

5.1.0.17

Date of report:

12/06/24

Patient data			
Name		Mrs. SHANTHI TWIN A	
Patient ID		0352406100020	
Birthday		04/04/02	
Sample ID		a0576894	
Age at sample date		22.2	
Sample Date		10/06/24	
Gestational age		11 + 3	
Correction factors			
Fetuses	2	IVF	no
Weight	35	diabetes	no
Smoker	no	Origin	Asian
Previous trisomy 21 pregnancies		unknown	
Biochemical data		Ultrasound data	
Parameter	Value	Corr. MoM	Gestational age
PAPP-A	15.41 mIU/mL	1.85	11 + 2
fb-hCG	67.32 ng/mL	0.48	Method
Risks at sampling date			CRL Robinson
Age risk	1:1009		Scan date
Biochemical T21 risk	<1:10000		09/06/24
Combined trisomy 21 risk	<1:10000		Crown rump length in mm
Trisomy 13/18 + NT	<1:10000		47
			Nuchal translucency MoM
			1.56
			Nasal bone
			present
			Sonographer
			N A
			Qualifications in measuring NT
			MD
Risk		Trisomy 21	
		The calculated risk for Trisomy 21 (with nuchal translucency) is below the cut off, which indicates a low risk. After the result of the Trisomy 21 test (with NT) it is expected that among more than 10000 women with the same data, there is one woman with a trisomy 21 pregnancy. The risk for this twin pregnancy has been calculated for a singleton pregnancy with corrected MoMs. The calculated risk by PRISCA depends on the accuracy of the information provided by the referring physician. Please note that risk calculations are statistical approaches and have no diagnostic value! The patient combined risk presumes the NT measurement was done according to accepted guidelines (Prenat Diagn 18: 511-523 (1998)). The laboratory can not be hold responsible for their impact on the risk assessment ! Calculated risks have no diagnostic value!	
Trisomy 13/18 + NT			
The calculated risk for trisomy 13/18 (with nuchal translucency) is < 1:10000, which represents a low risk.
