OBSTETRIC USG (EARLY ANOMALY SCAN) WITH PRE-ECLAMPSIA SCREENING

LMP: 20.04.2024

GA (LMP) : 12wk 4d

EDD : 25.01.2025

- Single live fetus seen in the intrauterine cavity in variable presentation.
- Spontaneous fetal movements are seen. Fetal cardiac activity is regular and normal & is 165 beats /min.
- PLACENTA: is grade I, anterior with lower edge just covering the os.
- LIQUOR: is adequate for the period of gestation.

Fetal morphology for gestation appears normal.

- Cranial ossification appears normal. Midline falx is seen. Choroid plexuses are seen filling the lateral ventricles. No posterior fossa mass seen. Spine is seen as two lines. Overlying skin appears intact.
- No intrathoracic mass seen. No TR .
- Stomach bubble is seen. Bilateral renal shadows is seen. Anterior abdominal wall appears intact.
- Urinary bladder is seen, appears normal. 3 vessel cord is seen.
- All four limbs with movement are seen. Nasal bone well seen & appears normal. Nuchal translucency measures 1.6 mm (WNL).
- Ductus venosus shows normal spectrum with positive "a" wave (PI ~ 1.27) .

FETAL GROWTH PARAMETERS

- | | | | | | | | |
|-------|------|----|---|----|-----|---|--------------------|
| ▪ CRL | 55.9 | mm | ~ | 12 | wks | 2 | days of gestation. |
|-------|------|----|---|----|-----|---|--------------------|
- Estimated gestational age is 12 weeks 2 days (+/- 1 week). EDD by USG : 27.01.2025
 - Internal os closed. Cervical length is WNL (32.3 mm).
 - Baseline screening of both uterine arteries was done & reveals mean PI of ~ 2.0 (WNL for gestation)

IMPRESSION:

- ± Single, live, intrauterine fetus of 12 weeks 2 days +/- 1 week.
- ± Gross fetal morphology is within normal limits.
- ± Low lying placenta with lower edge just covering the os.

Follow up at 19-20 weeks for target scan for detailed fetal anomaly screening.

Declaration : I have neither detected nor disclosed the sex of the fetus to pregnant woman or to anybody. (It must be noted that detailed fetal anatomy may not always be visible due to technical difficulties related to fetal position, amniotic fluid volume, fetal movements, maternal abdominal wall thickness & tissue ecogenicity. Therefore all fetal anomalies may not be detected at every examination. Patient has been counselled about the capabilities & limitations of this examination.)

First Trimester Screening Report

Trisomy 13

<1: 20000

Preeclampsia before 34 weeks

>1: 4

Fetal growth restriction before 37 weeks

>1: 4

The background risk for aneuploidies is based on maternal age (31 years). The adjusted risk is the risk at the time of screening, calculated on the basis of the background risk and ultrasound factors (fetal nuchal translucency thickness, nasal bone, tricuspid Doppler, fetal heart rate).

Risks for preeclampsia and fetal growth restriction are based on maternal demographic characteristics, medical and obstetric history, uterine artery Doppler and mean arterial pressure (MAP). The adjusted risk for PE < 34 weeks or the adjusted risk for FGR < 37 weeks is in the top 10% of the population. The patient may benefit from the prophylactic use of aspirin. All biophysical markers are corrected as necessary according to several maternal characteristics including racial origin, weight, height, smoking, method of conception and parity.

The estimated risk is calculated by the FMF-2012 software (version 2.81) and is based on findings from extensive research coordinated by the Fetal Medicine Foundation (UK Registered charity 1037116). The risk is only valid if the ultrasound scan was performed by a sonographer who has been accredited by the Fetal Medicine Foundation and has submitted results for regular audit (see www.fetalmedicine.com).
