**DEPARTMENT OF RADIODIAGNOSIS AND IMAGING  
SONOMAMMOGRAPHY OF BOTH BREASTS**

**Clinical history :** Check up.

**Technique:**

Ultrasound scan of breasts was performed with 7.5 MHz linear array transducer.

**Findings:**

Both breasts reveal predominantly fibroglandular parenchymal pattern with scanty fatty components.

Well defined hypoechoic area measuring 28 x 33 x 13 mm noted in pre mammary subcutaneous of right breast in the periareolar region at 4 -5 ' O clock position. ie surrounding inflammation and reactive hyperemia

No evidence of dilated ducts.

Pre-mammary, mammary and retromammary spaces are normal.

Both nipples, skin and subcutaneous tissues appear normal.

Both axillary regions appear normal. No significant lymphadenopathy.

Visualized pectoralis muscles appear normal.

**IMPRESSION:**

- **F/S/O evolving abscess in the subcutaneous plane and pre mammary space of right breast in the in inferomedial quadrant- likely secondary to infected sebaceous/epidermal inclusion cyst.**
- **Suggested clinical / FNAC and culture sensitivity correlation.**
