

Prisca 5.1.0.17
Date of report: 26-09-2024

Patient data			
Name	Mrs. NIKITA JADHAV		Patient ID
Birthday	19-05-1998	Sample ID	A0979626
Age at sample date	26.4	Sample Date	25-09-2024
Gestational age	12 + 2		
Correction factors			
Fetuses	1	IVF	no
Weight	71	diabetes	no
Smoker	no	Origin	Asian
		Previous trisomy 21 pregnancies	unknown
Biochemical data		Ultrasound data	
Parameter	Value	Corr. MoM	Gestational age
PAPP-A	3.21 mIU/mL	1.09	12 + 1
fb-hCG	14.37 ng/mL	0.34	Method
			CRL Robinson
			Scan date
			24-09-2024
Risks at sampling date		Trisomy 21	
Age risk	1:889	Crown rump length in mm	57
Biochemical T21 risk	<1:10000	Nuchal translucency MoM	1.00
Combined trisomy 21 risk	<1:10000	Nasal bone	present
Trisomy 13/18 + NT	<1:10000	Sonographer	NA
		Qualifications in measuring NT	MD
Risk graph showing age risk (1:10000) and biochemical risk (1:10000) curves. The age risk curve is green, and the biochemical risk curve is yellow. The combined risk curve is red. A vertical line at age 26.4 indicates the patient's risk, which is below the cut-off line.		The calculated risk for Trisomy 21 (with nuchal translucency) is below the cut off, which indicates a low risk. After the result of the Trisomy 21 test (with NT) it is expected that among more than 10000 women with the same data, there is one woman with a trisomy 21 pregnancy. The free beta HCG level is low. The calculated risk by PRISCA depends on the accuracy of the information provided by the referring physician. Please note that risk calculations are statistical approaches and have no diagnostic value! The patient combined risk presumes the NT measurement was done according to accepted guidelines (Prenat Diagn 18: 511-523 (1998)). The laboratory can not be hold responsible for their impact on the risk assessment ! Calculated risks have no diagnostic value!	
		Trisomy 13/18 + NT The calculated risk for trisomy 13/18 (with nuchal translucency) is < 1:10000, which represents a low risk.
