Trisomy 21	1: 665	1: 5214
Trisomy 18	1: 1693	1: 6763
Trisomy 13	1: 5292	<1: 20000

The background risk for aneuploidies is based on maternal age (30 years). The adjusted risk is the result of a combined screening, calculated on the basis of the background risk and ultrasound factors (fetal nuchal translucency thickness, nasal bone, fetal heart rate).

The estimated risk is calculated by the FMF-2012 software (version 2.81) and is based on findings from extensive research coordinated by the Fetal Medicine Foundation (UK Registered charity 1037116). The risk is only valid if the ultrasound scan was performed by a sonographer who has been accredited by the Fetal Medicine Foundation and has submitted results for regular audit (see www.fetalmedicine.com).

Crown-rump length

Nuchal translucency

1st trimester risk of Trisomy 21

Comments

-G. A. assigned as per CRL 13.3 weeks (CRL 72.9 mm)
-Estimated foetal weight is 429 +/- 43 gms.

-Discrepancy of 4 days between LMP & CRL GA, hence assigned EDD is same as LMP EDD is (28/04/2025)

-Aneuploidy Markers :

-Ductus venosus flow is normal. no 'a' wave reversal is seen
-Nasal bone present (2.5 mm) corresponding to 17 centile
-Nuchal thickness is (1.8 mm) corresponding to 45 centile
-Tricuspid regurgitation absent.

-Cervical length is 3.6 cm. No obvious funneling seen.

-Anatomy survey is negative for any congenital defect (subjected to variation)

-Isolated ultrasound calculation is at low risk (refer 1st page) of trisomy 21,18,13 (FMF software calculation)

-Screen negative for PIH.

Advice - PAPP-A & B.H.C.G & follow up at 18-20 weeks.

I Dr. Dilip Soni declared that while conducting ultrasound examination on this patient, I have neither detected sex of fetus nor disclose sex of her fetus to any body in any manner.
