- Nasal bone seen with nasal bone length of 2.0 mm.
- Ductus venosus reveals normal flow & spectral waveform.
- Left uterine artery show normal wave form and PI(0.71).
- Increased right uterine artery PI (1.87) with early diastolic notching. Mean PI is normal.
- No evidence of tricuspid regurgitation.

This scan is not level II scan this is done only to assess fetal growth parameters fetal weight and fetal well being

IMPRESSION

- Single live intrauterine foetus with changing presentation is seen at the time of examination, which corresponds to Gestational age 13 Weeks 0 days. EDD- 22.05.2025 +/- 10 Days.
- Increased right uterine artery PI (1.87) with early diastolic notching. Mean PI is normal.

Advice: Anomaly scan at 18-22 weeks

DISCUSSION

As per the ICD study has certain limitations. Sometimes fetal anomalies may not get diagnosed due to nature of anomaly, Gestational age, foetal position and limitations of machine. Therefore, the absence of mention of foetal anomaly in study does not always rule out its possibility. (Fetal anomaly scan is not 100% accurate).

Declaration: I have performed this ultrasound Derivography/Anomaly Scanning on patient. I have neither detected nor disclosed the sex of her foetus to anybody in any manner.
