

NA

Patient data			
Name	Mrs. JANAKI		Patient ID
Birthday	15/06/02	Sample ID	a1496091
Age at sample date	22.4	Sample Date	20/11/24
Gestational age	13 + 0		
Correction factors			
Fetuses	1	IVF	no
Weight	40	diabetes	no
Smoker	no	Origin	Asian
		Previous trisomy 21 pregnancies	unknown
Biochemical data		Ultrasound data	
Parameter	Value	Corr. MoM	Gestational age
PAPP-A	4.87 mIU/mL	0.56	Method
fb-hCG	35.62 ng/ml	0.86	CRL Robinson
Risks at sampling date			Scan date
Age risk	1:1062		16/11/24
Biochemical T21 risk	1:2349		Crown rump length in mm
Combined trisomy 21 risk	<1:10000		62
Trisomy 13/18 + NT	<1:10000		Nuchal translucency MoM
			0.75
			Nasal bone
			present
			Sonographer
			NA
			Qualifications in measuring NT
			MD
RISK		Trisomy 21	
The graph shows a risk curve that increases with age. A horizontal line at 1:10000 is labeled 'Cut off'. The area above the cut-off is red. The area below the cut-off is divided into yellow (above age risk) and green (below age risk). A black vertical bar is at age 23, reaching a risk level of approximately 1:10000.		The calculated risk for Trisomy 21 (with nuchal translucency) is below the cut off, which indicates a low risk. After the result of the Trisomy 21 test (with NT) it is expected that among more than 10000 women with the same data, there is one woman with a trisomy 21 pregnancy. The calculated risk by PRISCA depends on the accuracy of the information provided by the referring physician. Please note that risk calculations are statistical approaches and have no diagnostic value! The patient combined risk presumes the NT measurement was done according to accepted guidelines (Prenat Diagn 18: 511-523 (1998)). The laboratory can not be hold responsible for their impact on the risk assessment ! Calculated risks have no diagnostic value!	
Trisomy 13/18 + NT			
The calculated risk for trisomy 13/18 (with nuchal translucency) is < 1:10000, which represents a low risk.
