Important points to know on Antenatal Risk Factor testing

- Latest USG report (less than one month from data of sample collection) should be provided to obtain results with best precision and accuracy.
- For Double marker risk factor analysis, considering ***NT*** (Nuchal Translucency) measurement value from the USG report is ***higher sensitivity*** for test results.
- Biochemical Risk + NT is the same as Risk for Trisomy 21 (Down's Syndrome).
- For serum values above or below linearity of the software used (PRISCA), only the values can be provided. The graph cannot be generated.
  (Money cannot be refunded in such a case, since the test has already been performed)
- For cases with ***IVF (In Vitro Fertilization) / Assisted reproduction***, it is mandatory to provide the date of birth (DOB) of the egg donor.
- Double Marker, Triple Marker and Quadruple Marker risk factor analysis are screening tests suggestive of the probability of risk associated. These are not confirmatory tests.
