Patient data			
Name	Mrs. PALLAVI JADHAV		Patient ID
Birthday	27-10-2003		Sample ID
Age at sample date	21.2		Sample Date
Gestational age	11 + 4		
Correction factors			
Fetuses	1	IVF	no
Weight	48	diabetes	no
Smoker	no	Origin	Asian
		Previous trisomy 21 pregnancies	unknown
Biochemical data		Ultrasound data	
Parameter	Value	Corr. MoM	Gestational age
PAPP-A	17.8 mIU/mL	5.27	Method
fb-hCG	215.41 ng/mL	3.87	Scan date
Risks at sampling date			Crown rump length in mm 49 Nuchal translucency MoM 1.05 Nasal bone present Sonographer NA Qualifications in measuring NT MD
Age risk	1:1035		
Biochemical T21 risk	1:750		
Combined trisomy 21 risk	1:2349		
Trisomy 13/18 + NT	<1:10000		
			Trisomy 21
			The calculated risk for Trisomy 21 (with nuchal translucency) is below the cut off, which indicates a low risk. After the result of the Trisomy 21 test (with NT) it is expected that among 2349 women with the same data, there is one woman with a trisomy 21 pregnancy and 2348 women with not affected pregnancies. The free beta HCG level is high. The PAPP-A level is high. The calculated risk by PRISCA depends on the accuracy of the information provided by the referring physician. Please note that risk calculations are statistical approaches and have no diagnostic value! The patient combined risk presumes the NT measurement was done according to accepted guidelines (Prenat Diagn 18: 511-523 (1998)). The laboratory can not be hold responsible for their impact on the risk assessment ! Calculated risks have no diagnostic value!
Trisomy 13/18 + NT			
The calculated risk for trisomy 13/18 (with nuchal translucency) is < 1:10000, which represents a low risk.
