Patient data			
Name	Mrs. SARA QURESHI	Patient ID	0382501170118
Birthday	17/01/01	Sample ID	A1800636
Age at sample date	24.0	Sample Date	17/01/25
Gestational age	13 + 1		
Correction factors			
Fetuses	1	IVF	no
Weight	50	diabetes	no
Smoker	no	Origin	Asian
		Previous trisomy 21 pregnancies	unknown
Biochemical data		Ultrasound data	
Parameter	Value	Corr. MoM	
PAPP-A	4.08 mIU/mL	0.66	
fb-hCG	51.33 ng/mL	1.35	
Risks at sampling date			
Age risk	1:1020	Gestational age	13 + 2
Biochemical T21 risk	1:1222	Method	CRL Robinson
Combined trisomy 21 risk	1:5282	Scan date	18/01/25
Trisomy 13/18 + NT	<1:10000	Crown rump length in mm	73
		Nuchal translucency MoM	0.99
		Nasal bone	present
		Sonographer	N A
		Qualifications in measuring NT	MD
Risk		Trisomy 21	
The graph shows a risk curve that starts at approximately 1:1000 at age 13 and increases to about 1:100 at age 49. The patient's risk at age 25 is indicated by a black bar at approximately 1:5282, which is below the cut-off line.		The calculated risk for Trisomy 21 (with nuchal translucency) is below the cut off, which indicates a low risk. After the result of the Trisomy 21 test (with NT) it is expected that among 5282 women with the same data, there is one woman with a trisomy 21 pregnancy and 5281 women with not affected pregnancies. The calculated risk by PRISCA depends on the accuracy of the information provided by the referring physician. Please note that risk calculations are statistical approaches and have no diagnostic value! The patient combined risk presumes the NT measurement was done according to accepted guidelines (Prenat Diagn 18: 511-523 (1998)). The laboratory can not be hold responsible for their impact on the risk assessment ! Calculated risks have no diagnostic value!	
Trisomy 13/18 + NT			
The calculated risk for trisomy 13/18 (with nuchal translucency) is < 1:10000, which represents a low risk.
