## REPORT ON HISTOPATHOLOGY (BIOPSY)

**LAB HPE NO :-**

**HPR/226/24**

**TISSUE SOURCE:-**

Right upper lobe of lung mass

**GROSS DESCRIPTION:-**

Specimen of right upper lobe of lung mass received as single tissue piece measuring 6.5x6.0x2.5cm in dimension. Outer surface smooth and shiny. Cuts soft to firm. On cutting multiple tumor foci identified largest measuring 1.5x1.2cm and smallest measuring 0.5x0.5cm. Cut surface shows solid grey white area with irregular outline. Adjacent area also shows spongy greyish brown area. Representative section taken.

**MICROSCOPIC DESCRIPTION:-**

Section shows malignant tumor cells arranged in solid sheets, small clusters and singly infiltrated in to stroma. Individual malignant tumor cells have pleomorphic nucleus, high N/C ratio, hyperchromatic nuclei with inconspicuous nucleoli and moderate amount of eosinophilic cytoplasm. Mitotic figures also seen. Large area of necrosis also present.

**Diagnosis :-**

**NON SMALL CELL LUNG CARCINOMA (NSCLC)**

**POSSIBILITY OF - SQUAMOUS CELL CARCINOMA**

**Pathologist Remark**

**Immunohistochemistry (IHC) for further confirmation and categorization of diagnosis.**
