

Prisca 5.1.0.17
Date of report: 18/03/25

N A

Patient data			
Name Mrs. B.VENKATA LAKSHMI TWIN A		Patient ID 0042503170004	
Birthday 25/02/98		Sample ID 24496584	
Age at sample date 27.1		Sample Date 17/03/25	
Gestational age 12 + 3			
Correction factors			
Fetuses 2	IVF no	Previous trisomy 21 pregnancies unknown	
Weight 58	diabetes no		
Smoker no	Origin Asian		
Biochemical data		Ultrasound data	
Parameter	Value	Corr. MoM	Gestational age 12 + 3
PAPP-A	3.09 mIU/mL	0.42	Method CRL Robinson
fb-hCG	118.49 ng/mL	1.26	Scan date 17/03/25
Risks at sampling date			Crown rump length in mm 62
Age risk 1:853			Nuchal translucency MoM 1.25
Biochemical T21 risk 1:363			Nasal bone unknown
Combined trisomy 21 risk 1:745			Sonographer N A
Trisomy 13/18 + NT <1:10000			Qualifications in measuring NT MD
Risk			Trisomy 21
			The calculated risk for Trisomy 21 (with nuchal translucency) is below the cut off, which indicates a low risk. After the result of the Trisomy 21 test (with NT) it is expected that among 745 women with the same data, there is one woman with a trisomy 21 pregnancy and 744 women with not affected pregnancies. The risk for this twin pregnancy has been calculated for a singleton pregnancy with corrected MoMs. The calculated risk by PRISCA depends on the accuracy of the information provided by the referring physician. Please note that risk calculations are statistical approaches and have no diagnostic value! The patient combined risk presumes the NT measurement was done according to accepted guidelines (Prenat Diagn 18: 511-523 (1998)). The laboratory can not be hold responsible for their impact on the risk assessment ! Calculated risks have no diagnostic value!
Trisomy 13/18 + NT			
The calculated risk for trisomy 13/18 (with nuchal translucency) is < 1:10000, which represents a low risk.
