**CONCLUSION:**

- SINGLE LIVE INTRAUTERINE FETUS OF 12 WEEKS 4 DAYS IS PRESENT.
- PLEASE CORRELATE WITH DUAL/TRIPLE MARKER TEST.

Suggested Anomaly scan at 19 weeks: 11/05/2025  $\pm$  2 days

Please note that all anomalies can not be detected all the times due to various technical and circumstantial reasons like gestation period, fetal position, quantity of liquor etc. The present study can not completely confirm presence or absence of any or all the congenital anomalies in the fetus which may be detected on post natal period. Growth parameters mentioned herein are based on International Data and may vary from Indian standards. Date of delivery (at 40 weeks) is calculated as per the present sonographic growth of fetus and may not correspond with period of gestation by L.M.P. or by actual date of delivery. As with any other diagnostic modality, the present study should be correlated with clinical features for proper management. Except in cases of Fetal Demise or Missed Abortion, sonography at 20-22 weeks should always be advised for better fetal evaluation and also for base line study for future reference.

I, declare that while conducting sonography on SHUBHANGI SURAJ AMBHURE (name of pregnant woman), I have neither detected nor disclosed the sex of the fetus to anybody in any manner.
