

Patient data			
Name	Mrs. PRANALI BANSOD	Patient ID	0372504010095
Birthday	09-11-1989	Sample ID	A1558632
Age at sample date	35.4	Sample Date	01-04-2025
Gestational age	12 + 5		
Correction factors			
Fetuses	1	IVF	no
Weight	65	diabetes	no
Smoker	no	Origin	Asian
		Previous trisomy 21 pregnancies	unknown
Biochemical data		Ultrasound data	
Parameter	Value	Corr. MoM	
PAPP-A	1.16 mIU/mL	0.30	Gestational age 12 + 5
fb-hCG	38.41 ng/mL	0.99	Method CRL Robinson
Risks at sampling date			Scan date 01-04-2025
Age risk		1:251	Crown rump length in mm 66
Biochemical T21 risk		1:69	Nuchal translucency MoM 0.68
Combined trisomy 21 risk		1:475	Nasal bone present
Trisomy 13/18 + NT		1:4325	Sonographer N A
			Qualifications in measuring NT MD
Risk			Trisomy 21
The graph displays the risk of Trisomy 21 (red area) and Trisomy 13/18 + NT (green area) as a function of gestational age (x-axis, 13 to 49 weeks) and risk level (y-axis, 1:10000 to 1:10). A horizontal line at 1:250 represents the cut-off for low risk. The combined risk (yellow area) is below the cut-off line.			The calculated risk for Trisomy 21 (with nuchal translucency) is below the cut off, which indicates a low risk. After the result of the Trisomy 21 test (with NT) it is expected that among 475 women with the same data, there is one woman with a trisomy 21 pregnancy and 474 women with not affected pregnancies. The PAPP-A level is low. The calculated risk by PRISCA depends on the accuracy of the information provided by the referring physician. Please note that risk calculations are statistical approaches and have no diagnostic value! The patient combined risk presumes the NT measurement was done according to accepted guidelines (Prenat Diagn 18: 511-523 (1998)). The laboratory can not be hold responsible for their impact on the risk assessment ! Calculated risks have no diagnostic value!
Trisomy 13/18 + NT			
The calculated risk for Trisomy 13/18 (with nuchal translucency) is 1:4325, which represents a low risk.
