### REPORT ON HISTOPATHOLOGY

Ref. No. ND667/25  
Tissue Source:- Jejunum structure

Gross Examination:- Intestinal tissue received measuring 44cm in length. Outer surface show multiple blackish ulcerated area in the serosal surface with attached solid white area measuring 4.5x4.0 cm cut soft cut section shows solid white area. Representative sections taken.

Microscopy:- Section from attached solid white area show well circumscribed lesion with proliferation of round two oval cells few having high nucleocytoplasmic ratio with few bi-nucleated cells and multinucleation seen, occasional bizzare cells seen. Focal areas of necrosis evident.

Section from perforated tissue show intestinal mucosa with submucosa infiltrated with dense, mononuclear inflammatory cell infiltrate, comprising of lymphocytes and plasma cells.

**Diagnosis** **Biopsy is consistent with Neoplastic pathology with dense inflammation**

**Pathologist Remark** **Advice: IHC for further confirmation**
