Date of report: 13-05-2025

NA

Patient data			
Name	Mrs. AARTI NERIKAR	Patient ID	0372505120124
Birthday	29-04-1995	Sample ID	B2404605
Age at sample date	30.0	Sample Date	12-05-2025
Gestational age	13 + 1		
Correction factors			
Fetuses	1	IVF	no
Weight	63	diabetes	no
Smoker	no	Origin	Asian
		Previous trisomy 21 pregnancies	unknown
Biochemical data		Ultrasound data	
Parameter	Value	Corr. MoM	
PAPP-A	2.7 mIU/mL	0.57	
fb-hCG	37.41 ng/mL	1.06	
Risks at sampling date			
Age risk	1:657	Gestational age	12 + 4
Biochemical T21 risk	1:948	Method	CRL Robinson
Combined trisomy 21 risk	1:5510	Scan date	08-05-2025
Trisomy 13/18 + NT	<1:10000	Crown rump length in mm	63
		Nuchal translucency MoM	0.68
		Nasal bone	present
		Sonographer	NA
		Qualifications in measuring NT	NA
Risk		Trisomy 21	
The graph illustrates the risk of Trisomy 21 across different gestational ages. The risk is highest at younger ages and decreases as age increases. The patient's risk at 31 weeks is indicated by a black bar, showing it is below the cut-off.		The calculated risk for Trisomy 21 (with nuchal translucency) is below the cut off, which indicates a low risk. After the result of the Trisomy 21 test (with NT) it is expected that among 5510 women with the same data, there is one woman with a trisomy 21 pregnancy and 5509 women with not affected pregnancies. The calculated risk by PRISCA depends on the accuracy of the information provided by the referring physician. Please note that risk calculations are statistical approaches and have no diagnostic value! The patient combined risk presumes the NT measurement was done according to accepted guidelines (Prenat Diagn 18: 511-523 (1998)). The laboratory can not be hold responsible for their impact on the risk assessment ! Calculated risks have no diagnostic value!	
Trisomy 13/18 + NT			
The calculated risk for trisomy 13/18 (with nuchal translucency) is < 1:10000, which represents a low risk.
