Impression

Intrauterine gestation corresponding to a gestational age of 13 Weeks 1 Day
Gestational age assigned as per LMP

Placenta - Posterior grade II

Liquor - Adequate

For the crown rump length (CRL) of 72 mm the predicted gestational age is 13 weeks 3 days. The expected nuchal translucency (NT) is 1.85 mm (50th percentile)
Our measured NT value is 60 percentile for this CRL.

THANKS FOR REFERENCE.

Dr. Apoorv Singh Thakur, here by declare that while conducting the Sonography of Mrs. Menika gupta W/o Mr. Vikash Gupta, I have not disclosed the sex of the foetus to anyone in any manner

All anomalies cannot be detected in ultrasound due to certain technical limitations, obesity, certain fetal positions, fetal movements or abnormal amount of amniotic fluid.

All information given today is as per the findings on scan today but does not guarantee normality of all fetal organs structurally and functionally in future.

Also note that ultrasound permits assessment of fetal structural anatomy but not the function of these structures. All measurement including estimated fetal weight are subject to statistical variations.

Dr. APOORV SINGH THAKUR
