Name	MRS. GEETA DEVI	Age	55Y/F
Date	25/04/2025	Patient Id	250040745
Referring Doctor	DR. P.S. DUBEY MS. ORTHO.	Center	Pratima Hospital

MULTISLICE NON CONTRAST CT SCAN OF TEMPORAL BONE:

PROTOCOL:

Multislice CT imaging was performed using submillimeter thin contiguous axial plain scan of temporal bone from base to vertex. Coronal and sagittal reformatted images were obtained.

Findings:

- There is loss of pneumatization of bilateral mastoid air cells.
- Mild soft tissue is seen in left mastoid air cells and hypotympanum on left side.
- Bilateral middle ear cavities are aerated without any fluid density noted.
- The malleus, incus and stapes are normal in shape and size with preservation of the ossicular chain integrity and continuity on both sides.
- Sinus tympani, facial recess and pyramidal eminence are normal on both sides.
- Tegmen tympani and scutum are not eroded.
- The labyrinthine, tympanic and vertical parts of facial canal are also normal in course and caliber with no evidence of dehiscence on right side.
- Bilateral internal auditory canals are symmetrical and normal in size.
- The turns of the cochlea are well separate and normal in width and density.
- All three semicircular canals are normal in dimensions, density and orientation.
- The vestibular and cochlear aqueducts are normal in caliber.
- The jugular bulb is normal in location with no evidence of dehiscence.
- The carotid canal is normal in course and caliber.
- The external auditory canal is normal in appearance.
- The visualized posterior and middle cranial fossa structures are normal.

IMPRESSION:

Bilateral chronic mastoiditis with Left sided CSOM.

Recommended clinical correlation.
