IMPRESSION:-

- Single live intrauterine pregnancy cephalic presentation at the time of examination of 20 weeks + 01 days.

(All measurement including foetal weight is subject to statistical variation. Fetal echo is not done.)

Note: I Declare that while conducting USG, I have neither detected nor disclosed the sex of her fetus to any body in any manner.

Not all anomalies can be detected on sonography. Detection of anomalies is dependent on fetal position, gestational age. Maternal abdominal obesity and other technical parameters. Fetal limb anomalies not always detectable due to position. Evolving skeletal dysplasias cannot be detected, needs serial growth monitoring Follow up scanning and second opinion are always advisable. For detection of cardiac anomaly foetal echography is necessary. Ear anomalies cannot be detected.

With regards.
