**IMPRESSION:**

Single live intrauterine gestation of 13 weeks 3 days.

**Suggest: DOUBLE MARKER. Anomaly scan at 19-22 weeks of gestation for better evaluation.**

**DISCLAIMER:**

Not all fatal anatomical abnormalities can be detected on ultrasound examination the visualization of fetal parts depends on the fetal position, fetal movements and adequacy of liquor. Certain defects may not be visualized during the 2<sup>nd</sup> trimester. A follow up scan in the early third trimester of late 2<sup>nd</sup> trimester is advisable. The present study cannot exclude fetal chromosomal abnormalities because the ultrasound markers for these may not always be evident. Defects such as complex cardiac anomalies like TAPVR, PAPVR, PAPVD, small VSDs, ASDs, evolving conditions etc. lower gastrointestinal abnormalities, abnormalities involving hands, feet, ears, soft tissues etc. may not be detected on ultrasound examination.

\* I MRS. MANJIREE SONAWANE, declare that by undergoing ultrasonography/image scanning etc. I do not want to know the sex of my fetus.

Signature of pregnant women \*

I, DR.PRAVIN P. RENGE, declare that while conducting ultrasonography/image scanning etc. on MRS. MANJIREE SONAWANE, I have neither detected nor declared sex of her fetus to anybody in any manner.
