

ADWANI DIAGNOSTIC CENTRE

DR. C.P. ADWANI
MBBS, DMRD, (Goldmedalist)
Radiologist & Sonologist

PATIENT'S NAME : MRS MAHI SHARMA

AGE/SEX: 26Y/F

REFERRED BY :

DATE: 07/08/2025

OBSTETRICS SONOGRAPHY+NT SCAN

(The real time, B mode, sonography of gravid uterus was performed.)
The L.M.P. : 17/05/2025
The Gestational age from L.M.P. is : 11 Wks 05 days
The E.D.D. from L.M.P. : 21/02/2026

OBSERVATIONS:

- The uterus is bulky.
- A single gestational sac is noted in uterine cavity with regular margins and trophoblastic reaction.
- The yolk sac echo is seen.
- The foetal poles are visible.
- The CRL is 55.6 mm is corresponding 12Wks. 01day
- The foetal cardiac pulsations present FHR -166B/PM
- Placenta is anterior and grade 0 maturity
- cervix is short (32mm)
- The internal os closed

IMPRESSION:- SINGLE, LIVE, NORMAL INTRAUTERINE FOETUS 12WKS 01DAYS

- USG EDD- 18/02/2026 (+ 1 WKS.) WITH SHORT CERVIX (3.2CM)
- G AGE BY USG CORRESPONDING WITH G AGE BY LMP
- NUCHAL TRANSLUCENCY APPEAR NORMAL (1.20MM)
- DUCTUS VENOSUS FLOW APPEAR NORMAL
- NASAL BONE APPEAR NORMAL (1.59 MM)
- PI INDEX RIGHT UTERINE ARTERY -1.4
- PI INDEX LEFT UTERINE ARTERY -1.7

NEXT USG SUGGESTION

DR. C.P. ADWANI

MBBS, DMRD
CONSULTANT RADIOLOGIST & SONOLOGIST

Thanks for the referral

PLEASE CORRELATE WITH CLINICAL OTHER LAB. FINDINGS

I DR C.P. ADWANI declare that while conducting ultrasonography on MRS .
detected nor disclosed the sex of her foetus to any body in any manner.

MAHI SHARMA

I have neither

FACILITIES : COLOR DOPPLER, 4D SONOGRAPHY, DIGITAL X-RAY, O.P.G., E.C.G.

Netaji Chowk, Katora Talab, Raipur (C.G.), Ph. : 0771 - 4269568

OBSTETRICS SONOGRAPHY+NT SCAN

Risk assessment

Risk for trisomies at 11-13 weeks

This application allows estimation of risk for trisomies 21, 18 and 13 at 11-13 weeks' gestation by a combination of maternal age, fetal nuchal translucency (NT), free beta hCG and maternal serum free beta hCG and PAPP-A. The values for PAPP-A and free beta hCG depend on maternal characteristics and reagents used for analysis and they therefore need to be converted into MoM's.

In the application above you can either use the MoM values reported by the laboratory or enter the raw data and the MoM values will be calculated.

Risks from History

Trisomy 21: 1 in 780

Trisomy 13/18: 1 in 1800

The risk from history is based on a maternal age of 27 years and previous affected pregnancies.

Risks from History: NT, DV PI

Trisomy 21: 1 in 10000

Trisomy 13/18: 1 in 10000

The adjusted risk is the risk at the time of screening. The calculation is based on the background risk and the following parameters: Ultrasound factors (NT, DV PI).

Risk T21

FACILITIES : COLOR DOPPLER, 4D SONOGRAPHY, DIGITAL X-RAY, O.P.G., E.C.G.

Netaji Chowk, Katora Talab, Raipur (C.G.), Ph. : 0771 - 4269568
