Patient data					
Name	Mrs. PAPIYA DAS W/O HAV SRIBAS		Patient ID	0782508220029	
Birthday	04-02-1993		Sample ID	A1117489	
Age at sample date	32.5		Sample Date	22-08-2025	
Gestational age	13 + 5				
Correction factors					
Fetuses	1	IVF	no	Previous trisomy 21 pregnancies	unknown
Weight	47	diabetes	no		
Smoker	no	Origin	Asian		
Biochemical data			Ultrasound data		
Parameter	Value	Corr. MoM	Gestational age	13 + 5	
PAPP-A	9.81 mIU/mL	0.99	Method	CRL Robinson	
fb-hCG	30.74 ng/ml	0.93	Scan date	22-08-2025	
Risks at sampling date			Crown rump length in mm	79.9	
Age risk	1:460		Nuchal translucency MoM	0.68	
Biochemical T21 risk	1:3292		Nasal bone	present	
Combined trisomy 21 risk	<1:10000		Sonographer	NA	
Trisomy 13/18 + NT	<1:10000		Qualifications in measuring NT	MD	
Trisomy 21			The calculated risk for Trisomy 21 (with nuchal translucency) is below the cut off, which indicates a low risk. After the result of the Trisomy 21 test (with NT) it is expected that among more than 10000 women with the same data, there is one woman with a trisomy 21 pregnancy. The calculated risk by PRISCA depends on the accuracy of the information provided by the referring physician. Please note that risk calculations are statistical approaches and have no diagnostic value! The patient combined risk presumes the NT measurement was done according to accepted guidelines (Prenat Diagn 18: 511-523 (1998)). The laboratory can not be hold responsible for their impact on the risk assessment ! Calculated risks have no diagnostic value!		
The graph shows the relationship between gestational age (x-axis, 13 to 49 weeks) and risk (y-axis, 1:10 to 1:10000). The graph is divided into three colored regions: green (below cut off), yellow (Below Cut Off, but above Age Risk), and red (above cut off). A black vertical line indicates the patient's risk at 13 weeks 5 days, which is in the green region.			Trisomy 13/18 + NT The calculated risk for trisomy 13/18 (with nuchal translucency) is < 1:10000, which represents a low risk.
