Risk				Trisomy 21	
				<b>The calculated risk for Trisomy 21 (with nuchal translucency) is below the cut off, which indicates a low risk.</b>	
				After the result of the Trisomy 21 test (with NT) it is expected that among 3985 women with the same data, there is one woman with a trisomy 21 pregnancy and 3984 women with not affected pregnancies. The calculated risk by PRISCA depends on the accuracy of the information provided by the referring physician. Please note that risk calculations are statistical approaches and have no diagnostic value! The patient combined risk presumes the NT measurement was done according to accepted guidelines (Prenat Diagn 18: 511-523 (1998)). The laboratory can not be hold responsible for their impact on the risk assessment ! Calculated risks have no diagnostic value!	
Trisomy 18				Neural tube defects	
<b>The calculated risk for trisomy 18 (with nuchal translucency) is &lt; 1:10000, which represents a low risk.</b>				<b>The corrected MoM AFP (1.07) is located in the low risk area for neural tube defects.</b>
