Risk				Trisomy 21			
				The calculated risk for Trisomy 21 is below the cut off which represents a low risk. After the result of the Trisomy 21 test it is expected that among 273 women with the same data, there is one woman with a trisomy 21 pregnancy and 272 women with not affected pregnancies. The HCG level is high. The calculated risk by PRISCA depends on the accuracy of the information provided by the referring physician. Please note that risk calculations are statistical approaches and have no diagnostic value!			
Trisomy 18				Neural tube defects risk			
The calculated risk for trisomy 18 is < 1:10000, which indicates a low risk.				The corrected MoM AFP (1.43) is located in the low risk area for neural tube defects.
