Disclaimer: Impression is a professional opinion and not a diagnosis. The science of radiological diagnosis is based on the interpretation of various shadows and is neither complete nor accurate. All modern machines/procedures have their limitations. Further pathological and radiological investigations with clinical correlations are required to ensure an accurate reach the final diagnosis. In case of any clinical/other discrepancy, please contact. Hard copy is attached for review. Not for medico-legal purposes. Patient identity cannot be verified. Please note that all anomalies can not be detected all the times due to various technical and circumstantial reasons like gestation period, fetal position, quantity of liquor etc. The present study cannot completely confirm presence or absence of any or all the congenital anomalies in the fetus which may be detected on post-natal period. Growth parameters mentioned herein are based on International Data and may vary from Indian standards. Date of delivery (at 40 weeks) is calculated as per the present sonographic growth of fetus and may not correspond with period of gestation by L.M.P. or by actual date of delivery. As with any other diagnostic modality, the present study shall be correlated with clinical features for proper management. Except in cases of Fetal Demise or Missed Abortion, sonography at 20-22 weeks should always be advised for better fetal evaluation and also for base line study for future reference.
