Patient data			
Name	Mrs. MONALISHA DAS	Patient ID	0652509270182
Birthday	18/03/00	Sample ID	B3892407
Age at sample date	25.5	Sample Date	27/09/25
Gestational age	13 + 0		
Correction factors			
Fetuses	1	IVF	no
Weight	42	diabetes	no
Smoker	no	Origin	Asian
		Previous trisomy 21 pregnancies	unknown
Biochemical data		Ultrasound data	
Parameter	Value	Corr. MoM	
PAPP-A	2.69 mIU/mL	0.37	
fb-hCG	34.36 ng/mL	0.81	
Risks at sampling date			
Age risk	1:953	Gestational age	12 + 6
Biochemical T21 risk	1:788	Method	CRL Robinson
Combined trisomy 21 risk	1:2692	Scan date	26/09/25
Trisomy 13/18 + NT	<1:10000	Crown rump length in mm	67.6
		Nuchal translucency MoM	1.11
		Nasal bone	present
		Sonographer	NA
		Qualifications in measuring NT	NA
Risk		Trisomy 21	
The graph shows a risk curve that increases with age. At age 25, the risk is approximately 1:2692, which is below the cut-off (1:1000) but above the age risk (1:953).		The calculated risk for Trisomy 21 (with nuchal translucency) is below the cut off, which indicates a low risk. After the result of the Trisomy 21 test (with NT) it is expected that among 2692 women with the same data, there is one woman with a trisomy 21 pregnancy and 2691 women with not affected pregnancies. The PAPP-A level is low. The calculated risk by PRISCA depends on the accuracy of the information provided by the referring physician. Please note that risk calculations are statistical approaches and have no diagnostic value! The patient combined risk presumes the NT measurement was done according to accepted guidelines (Prenat Diagn 18: 511-523 (1998)). The laboratory can not be hold responsible for their impact on the risk assessment ! Calculated risks have no diagnostic value!	
Trisomy 13/18 + NT			
The calculated risk for trisomy 13/18 (with nuchal translucency) is < 1:10000, which represents a low risk.
