HISTOPATHOLOGY

Specimen : True cut Biopsy from Right breast.

Gross : Received true cut biopsy tissue from right breast lump.
Which is 2 to 3 small pieces and measuring about
1 X 0.2 X 0.1 cm in all. All were embedded.

Microscopy : Sections show pleomorphic ductal epithelial cells arranged in small groups, trabeculae and tubulo-glandular structure invaginating into the surrounding stroma. Cells are round to oval shaped having vesicular nuclear chromatin and prominent nucleoli. Few mitotic figures are seen. Tumor cells are seen infiltrating into the overlying skin and vessels.

Impression : **Histological types** : Invasive ductal carcinoma ; Right Breast

IHC Advised for Grading and Confirmation.

Lab. Technologist

Dr. Santanu Kumar
