Regn Centre : **PH-MAYUR COLONY - 602**

DEPARTMENT OF RADIOLOGY AND IMAGING SCIENCES
NT SCAN

LMP Date :

01/09/2025 (EDD : 08/06/2026) Gestational age by LMP : 12 weeks and 5 days.

Findings :

There is a single live intrauterine gestation noted in changing lie, exhibiting normal cardiac activity and movements.

CRL – 62.30 mm corresponding to 12 weeks and 4 days. (EDD : 09/06/2026) FHR : 161 bpm.

Placenta is developing fundal. No evidence of subchorionic haemorrhage is seen.

The internal os is closed. The cervical canal is within normal limits. **Liquor** is adequate.

Nuchal translucency measures 1.2 mm and is normal. Nasal bone is normal.

All four limbs visualised and are normal. Fetal stomach and bladder visualised.

Ductus venosus shows normal forward flow without any reversal of 'a' wave.

Right Uterine PI: 2.23 Left Uterine PI: 1.95 Mean PI: 2 (within normal limits)

IMPRESSION :

Single live intrauterine fetus in changing lie at present scan of average gestational age 12 weeks and 4 days.

Suggested anomaly scan at 19-20 weeks of gestation.

Note : * All congenital anomalies are not detected by sonography and are subject to foetal position.

* Only structural anomalies are detected by sonography.

* All measurements including birth weight are subject to statistical variations.

(I, Dr. Ajinkya Redij, declare that while conducting sonography of gravid uterus, I have neither detected nor disclosed the sex of her foetus to anybody in any manner or in any form.)

(Investigations have their limitations. Radiological / Pathological and other investigations never confirm the final diagnosis. They help in diagnosing the disease in correlation to clinical symptom and other related test. Please interpret accordingly).

DR. AJINKYA VINAYAK REDIJ
Consultant Radiologist
